

# Physics Equations Sheet

## GCSE Combined Science: Trilogy (8464) and GCSE Combined Science: Synergy (8465)

FOR USE IN JUNE 2024 ONLY

HT = Higher Tier only equations

|                                                                                                                |                                |
|----------------------------------------------------------------------------------------------------------------|--------------------------------|
| kinetic energy = $0.5 \times \text{mass} \times (\text{speed})^2$                                              | $E_k = \frac{1}{2} m v^2$      |
| elastic potential energy = $0.5 \times \text{spring constant} \times (\text{extension})^2$                     | $E_e = \frac{1}{2} k e^2$      |
| gravitational potential energy = $\text{mass} \times \text{gravitational field strength} \times \text{height}$ | $E_p = m g h$                  |
| change in thermal energy = $\text{mass} \times \text{specific heat capacity} \times \text{temperature change}$ | $\Delta E = m c \Delta \theta$ |
| power = $\frac{\text{energy transferred}}{\text{time}}$                                                        | $P = \frac{E}{t}$              |
| power = $\frac{\text{work done}}{\text{time}}$                                                                 | $P = \frac{W}{t}$              |
| efficiency = $\frac{\text{useful output energy transfer}}{\text{total input energy transfer}}$                 |                                |
| efficiency = $\frac{\text{useful power output}}{\text{total power input}}$                                     |                                |
| charge flow = $\text{current} \times \text{time}$                                                              | $Q = I t$                      |
| potential difference = $\text{current} \times \text{resistance}$                                               | $V = I R$                      |
| power = $\text{potential difference} \times \text{current}$                                                    | $P = V I$                      |
| power = $(\text{current})^2 \times \text{resistance}$                                                          | $P = I^2 R$                    |
| energy transferred = $\text{power} \times \text{time}$                                                         | $E = P t$                      |

|    |                                                                                                                                                        |                          |
|----|--------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------|
| HT | energy transferred = charge flow × potential difference                                                                                                | $E = Q V$                |
|    | <b>potential difference across primary coil × current in primary coil =<br/>potential difference across secondary coil × current in secondary coil</b> | $V_p I_p = V_s I_s$      |
|    | density = $\frac{\text{mass}}{\text{volume}}$                                                                                                          | $\rho = \frac{m}{V}$     |
|    | thermal energy for a change of state = mass × specific latent heat                                                                                     | $E = m L$                |
|    | weight = mass × gravitational field strength                                                                                                           | $W = m g$                |
|    | work done = force × distance (along the line of action of the force)                                                                                   | $W = F s$                |
|    | force = spring constant × extension                                                                                                                    | $F = k e$                |
|    | distance travelled = speed × time                                                                                                                      | $s = v t$                |
|    | acceleration = $\frac{\text{change in velocity}}{\text{time taken}}$                                                                                   | $a = \frac{\Delta v}{t}$ |
|    | (final velocity) <sup>2</sup> – (initial velocity) <sup>2</sup> = 2 × acceleration × distance                                                          | $v^2 - u^2 = 2 a s$      |
| HT | resultant force = mass × acceleration                                                                                                                  | $F = m a$                |
|    | <b>momentum = mass × velocity</b>                                                                                                                      | $p = m v$                |
|    | period = $\frac{1}{\text{frequency}}$                                                                                                                  | $T = \frac{1}{f}$        |
| HT | wave speed = frequency × wavelength                                                                                                                    | $v = f \lambda$          |
|    | <b>force on a conductor (at right angles to a magnetic field) carrying a current =<br/>magnetic flux density × current × length</b>                    | $F = B I l$              |
